

Cosmos DB Connection

With this connection type, it is possible to connect to Azure Cosmos DB, which is a globally distributed, multi-model database service that stores different types of items in various types of containers, depending on the API used. **Jedox currently supports the APIs for SQL and for MongoDB.**

Main Settings

Host:	The host name (DNS name) or the IP address of the server on which the database is located
Port:	The TCP/IP port number used by the database
Database:	Name, schema, or instance of the relational database
User name:	User name for the connection to the database
Password:	Password string for MongoDB can be found under Connection String→Primary Password on the Microsoft Azure Portal. Password for SQL can be found under Keys→Primary Key on the Microsoft Azure Portal.
Cosmos Model/API:	MongoDB or SQL

Advanced Settings

Timeout (in s):	The server selection timeout in seconds. Default value is 0, which means it will try to make a connection endlessly.
