

Insert a Subset in the Area of an Existing Subset

Note:

The features described in this article are not yet implemented in the Subseteditor of Jedox Web.

When inserting a subset in the range of an existing subset, in Jedox Excel Add-in the existing subset settings will be read and passed to the Subseteditor.

If you select exactly one cell within the matrix of an existing subset and then insert a new subset with the subset editor, the new subset will use the exact area of the existing subset.

If you select several cells partially or wholly overlapping an existing subset and then insert a new subset with the subset editor, then all previous subset matrix cells are deleted and the new subset will be inserted in the existing subset area.
