

Reachability of files for Integrator operations

The reachability of files for Integrator operations depends on the project site from which the operation is called.

When browsing files from a global project, all local groups, their hierarchies, and all global models are visible in tree on the left. They are reachable for operations called from inside of the global project. Projects resp. models sited in namespaces are not visible in tree on the left. Their files are not reachable for operations called from inside of the global project.

When browsing files from a project inside a model, all local groups, their hierarchies, and the files only from that model are visible in tree on the left. They are reachable for operations of the current project. Other models (with or without namespaces) are not visible and their files are not reachable for operations called from inside of the current project.
