

Turn Off Currency Conversion

[Return to Models Overview](#)

In the case that your organization's operations are conducted in one currency, [currency conversion](#) can be turned off to improve your model's performance, turn off currency conversion using the following steps:

Update the Legal Entity dimension with your default currency

Update the [Currency](#) attribute of the [Legal Entity](#) dimension with your default currency. In this example, all legal entities have had this attribute updated to US Dollar ([USD](#)).

Element	Type	Parent Element	Weight	Name	ID_Name	Country	Currency	Terminat	Sign Standard
Total Group	12			Total Group	Total Group				
---	Total Group	---	+1	Not applicable	---				
Unassigned	Total Group	Unassigned	+1	Unassigned	Unassigned - Unassigned				
12	Total Group	+1	Best Recipe USA LLC	12 - Best Recipe USA LLC	US	USD	1	****	
99	Total Group	+1	Bliley Best Corp.	99 - Bliley Best Corp.	US	USD	1	****	

Remove unneeded conversions from the Currency dimension

1. Remove all explicit input currencies (e.g. [EUR](#)) except for the default currency from the [All Currencies](#) parent element. Keep the Local Currency ([LC](#)) and the No Currency ([XXX](#)) elements. To remove right-click on the element and select [Remove from Selected Parent](#) in the context menu, that removes them from the [All Currencies](#)

hierarchy but does not delete them from other parents (e.g. [Unassigned](#) parent element).

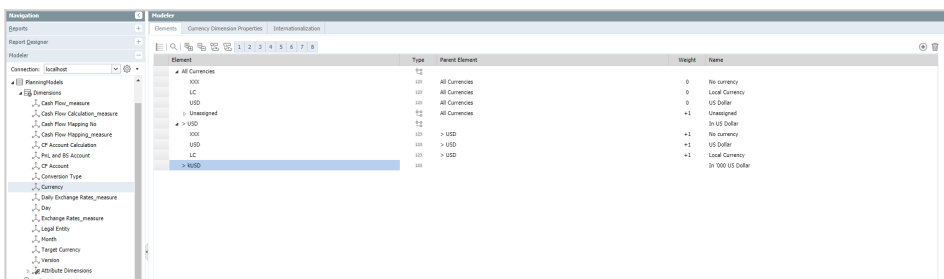

2. Remove all implicit currency conversion (e.g. [LC > EUR](#)) and explicit currency conversion (e.g. [MXN > EUR](#)) elements from the dimension, including that of the default currency.

3. Remove all consolidated currency conversion (e.g. [> EUR](#)) elements except for the conversion into the default currency.

4. Remove all scaling currency (e.g. [kEUR](#) and [MEUR](#)) elements except for the scaling currency elements of the default currency.

5. Add [LC](#) as a child of the consolidated currency conversion of the default currency. To do this right-click on the element and select [Add to \(additional\) Parent](#) in the context menu.

The example below shows the end result of deleting the unnecessary currencies from the [All Currencies](#) element as well as keeping the [XXX](#), [LC](#), scaling currency and the default currency, [USD](#).

See the article [Fact Cube Using Currency Conversion](#) for more details

on the currency conversion.
