

Virtual Private Network Gateway

A Virtual Private Network (VPN) gateway is a specific type of virtual network gateway used to send encrypted traffic between Jedox Cloud's virtual network and an on-premises location over the public internet. VPN gateway can also be used to send encrypted traffic between Azure virtual networks over the Microsoft Network.

Site-to-site VPN establishes a VPN tunnel between Jedox Cloud and your company network. A site-to-site connection requires a VPN device located on-premises that has a public IP address assigned to it and is not located behind a network address translation (NAT).

To configure the site-to-site VPN gateway for Jedox Cloud, you need a compatible VPN device as a part of your network infrastructure. For a list of available VPN devices, check [this article](#).
